# Field pea blackspot risk forecast for New South Wales

Field Pea Blackspot Risk Forecast is a location and season specific weekly forecast. It accounts for varietal resistance and chemical options, agronomic yield potentials, agronomic constraints (frost and terminal drought), risks of spore showers, disease severity, and disease related yield loss. It then weighs agronomic yield loss and disease yield loss and suggests a window of sowing dates.

This prediction is based on DPIRD's Blackspot Manager model using weather data from 1 January 2026 to 3 May 2026 from the nearest weather station.

You may notice weather station changes for some locations. This is to ensure that the weather data being used is the most accurate available for the area and uses open BOM weather stations whenever possible. In some locations, a suitable weather station may not be available and so we may use interpolated weather data, which uses data from surrounding stations to create reasonable values for missing weather data.

Sowing time can depend on a range of factors and it is recommended to consult an agronomist to determine the optimal sowing window for your situation.

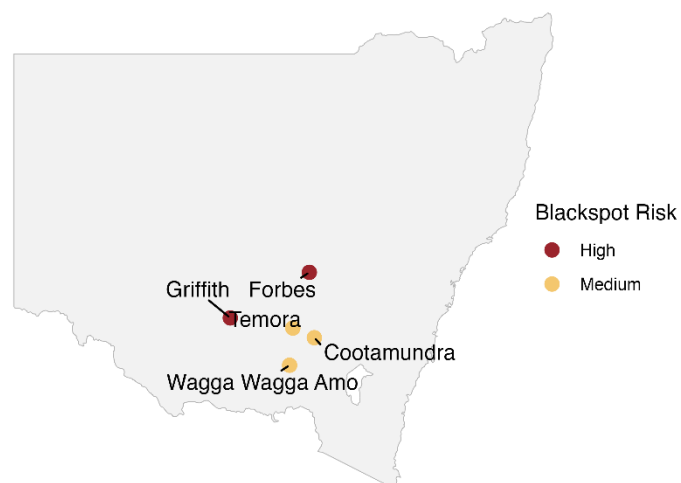

## Missing a location or would like to receive email or sms alerts?

Sign up today to get alerts and add your local weather station. Text 'blackspot', your name and nearest weather station to 0475 959 932 or email [BlackspotManager@dpird.wa.gov.au](mailto:BlackspotManager@dpird.wa.gov.au).

## Key to blackspot severity scores

The aim is to delay sowing of field pea crops, where agronomically possible, until the majority of blackspot spores (approximately 60%) have been released prior to the crop emergence. This strategy reduces yield losses from blackspot.

*Map showing the relative current risk of spores based upon blackspot model outputs for various location in NSW, 4<sup>th</sup> May 2026.*

| Blackspot risk | Spores released (%) | Range of yield loss for different levels of blackspot risk (%) |
|----------------|---------------------|--|
| Low            | 60 - 100            | 2 - 15   |
| Medium         | 30 - 59             | 20 - 35  |
| High           | 0 - 29              | 25 - 50  |

**Note. Locations have been listed A-Z**

## Cootamundra

Last date used for prediction: 3 May 2026

Rainfall to date: 187.5 mm

Days with significant stubble moisture: 52

| Forecast for crops sown on                    | 4 May                          | 10 May                         | 17 May                         |
|---|--------------------------------|--------------------------------|--------------------------------|
| Sowing guide (based on agronomic suitability) | Too early to sow before 20 May | Too early to sow before 20 May | Too early to sow before 20 May |
| Blackspot risk                                | Medium                         | Low                            | Low                            |

## Forbes

Last date used for prediction: 3 May 2026

Rainfall to date: 154.8 mm

Days with significant stubble moisture: 34

| Forecast for crops sown on                    | 4 May                          | 10 May                         | 17 May                                     |
|---|--------------------------------|--------------------------------|--|
| Sowing guide (based on agronomic suitability) | Too early to sow before 13 May | Too early to sow before 13 May | Marginally too early to sow - 13 to 19 May |
| Blackspot risk                                | High                           | High                           | Medium                                     |

## Griffith

Last date used for prediction: 3 May 2026

Rainfall to date: 36.2 mm

Days with significant stubble moisture: 21

| Forecast for crops sown on                    | 4 May                         | 10 May                                    | 17 May    |
|---|-------------------------------|---|-----------|
| Sowing guide (based on agronomic suitability) | Too early to sow before 5 May | Marginally too early to sow - 5 to 12 May | OK to sow |
| Blackspot risk                                | High                          | High                                      | High      |

## Temora

Last date used for prediction: 3 May 2026

Rainfall to date: 148.1 mm

Days with significant stubble moisture: 42

| Forecast for crops sown on                    | 4 May                          | 10 May                         | 17 May                                     |
|---|--------------------------------|--------------------------------|--|
| Sowing guide (based on agronomic suitability) | Too early to sow before 12 May | Too early to sow before 12 May | Marginally too early to sow - 13 to 19 May |
| Blackspot risk                                | Medium                         | Medium                         | Medium                                     |

## Wagga Wagga AMO

Last date used for prediction: 3 May 2026

Rainfall to date: 133.8 mm

Days with significant stubble moisture: 51

| Forecast for crops sown on                    | 4 May                          | 10 May                         | 17 May                         |
|---|--------------------------------|--------------------------------|--------------------------------|
| Sowing guide (based on agronomic suitability) | Too early to sow before 20 May | Too early to sow before 20 May | Too early to sow before 20 May |
| Blackspot risk                                | Medium                         | Low                            | Low                            |
